Shipping Data Foundation

Can free data support an honest listed-shipping backtest?

Linked research component | 5 November 2026

THE RESULT The audit documents a bad FX print, a missed liquidating distribution and four recycled tickers that could manufacture apparent returns.

APPROACH

A dated 73-company register retains exits, identifies recycled tickers and rebuilds total returns from prices and distributions. FX and zero-volume treatment are explicit.

WHY IT MATTERS

Shipping includes delistings, takeovers and distributions that can seriously distort a backtest. The register preserves those events and the gaps that remain.

SCOPE & LIMITATIONS

Missing bankrupt-company histories mean survivorship bias is not eliminated. Source corrections need independent spot checks.

EXPLORE

Read the universe audit notebook and inspect a corrected distribution.
