Shipping Market-Neutral Selection

Is public-data stock-selection alpha distinguishable from luck?

Linked research component | 5 November 2026

THE RESULT Reported 2023-October 2026 holdout Sharpe is 0.42, return 2.1% per year, drawdown -7.2%, beta -0.01; deflated-Sharpe probability is 0.31.

APPROACH

Within-segment value and residual signals feed a hedged portfolio with costs, borrow, capacity stresses, yearly selection and a logged 27-trial search.

SCOPE & LIMITATIONS

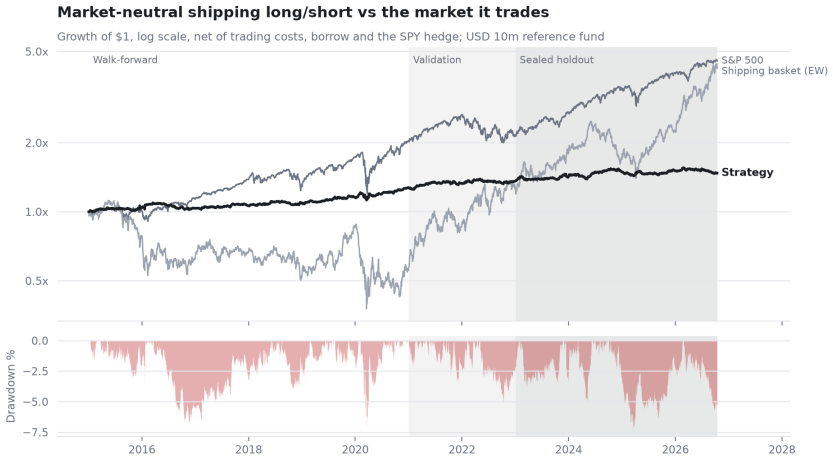

The search-adjusted result does not establish skill. Capacity is assumption-dependent; retrospective pre-registration needs chronology scrutiny.

WHY IT MATTERS

The trial log, holdout and cost assumptions let a reader distinguish market neutrality and weak historical performance from evidence of skill.

EXPLORE

Inspect the summary notebook, trial log and preregistration before rerunning the holdout.

Historical backtest; see notebook for dates and cost assumptions.
